CREATION OF A Weighted Undirected graph representing MUBAS Campus Network OF Buildings and Hostels.

1) A graph is a datastructure, consisting of vertices and edges connecting the vertices, A weighted graph is a graph in which each edge has a numerical value called a weight, weight represent distance between Two ~~edge~~ vertices.
~~An~~ undirected graph is a graph in which edges have no arrows, Meaning that Movement between two connecting vertices is possible in either direction.

The graph contains 20 nodes and each node repents a campus facility, while each edge represents a walkway that connect two ~~facilities~~ Buildings, The weighted assigned to each edge represents ~~a road~~ the distance between the vertices which are Buildings the assumed distance is in metres.

Vertices refers to 20 campus location The graph contain 20 vertices labelled A to T representing different location.

Vertex	campus location
A	Main Gate
B	Wet Building
C	Library
D	Electrical Engineering Building
E	Civil Engineering Building
F	ICT laboratory
H	ICT, ODEL Building
